

## Strength of Materials 2

### FOREWORD

### NOTE

#### Chapter 1. STATICALLY INDETERMINATE BEAMS

- 1.1. Definitions
- 1.2. Method of forces
- 1.3. Statically indeterminate systems with symmetry properties
- 1.4. Practical guide for strength calculations of statically indeterminate beams
- 1.5. Worked examples
- 1.6. Proposed problems
- 1.7. Solutions to proposed problems

#### Chapter 2. BUCKLING OF STRUTS

- 2.1 Definitions
- 2.2 The general equation of the critical buckling force for elastic buckling
- 2.3 Validity of Euler's theory
- 2.4 Practical guide for buckling calculations
- 2.5 Worked examples
- 2.6 Proposed problems
- 2.7 Solutions to proposed problems

#### Chapter 3. DYNAMIC LOADINGS

- 3.1 Definitions
- 3.2 Dynamic forces
- 3.3 Impact loadings
- 3.4 Practical guide for strength calculations at impact loadings
- 3.5 Worked examples
- 3.6 Proposed problems
- 3.7 Solutions to proposed problems

#### Chapter 4. BASICS OF THEORY OF ELASTICITY

- 4.1 The stress state around a point
- 4.2 Plane stress
- 4.3 The strain state around a point
- 4.4 Plane strain
- 4.5 The generalized Hooke's law
- 4.6 The strain energy density

## Chapter 5. COMBINED LOADING

5.1 Introduction

5.2 Failure theories

5.3 Failure envelopes

5.4 Application of failure theories to bars

5.5 Practical guide for strength calculations at combined loadings

5.6 Worked examples

5.7 Proposed problems

5.8 Solutions to proposed problems

## Chapter 6. FATIGUE

6.1 Introduction

6.2 Definitions, quantities, notations

6.3 The fatigue limit

6.4 The diagrams of fatigue limit

6.5 Factors that influence the fatigue limit

6.6 Fatigue calculations for stationary variable loadings

6.7 Practical guide for stress based fatigue calculations

6.8 Worked examples

6.9 Proposed problems

6.10 Solutions to proposed problems

## Chapter 7. EXPERIMENTAL METHODS FOR STRESS ANALYSIS

7.1 Introduction

7.2 The strain gauge method

7.3 Photoelasticity

## REFERENCES
