Advanced Ecology. Monitoring, diagnostics, prognosis vol. 2

Content

Summary

Preface

Abbreviations and acronyms

Chapter 1. Advanced Ecological Theory

1.1 Introduction

1.2 Perspective trends in advanced ecology

1.3 Constructive approach to the modeling of climate-biosphere-society system

1.4. Biocomplexity related to the ecosystem survivability

1.5 Main ecological problems of the environment

Chapter 2. Basic Principles of Advanced Ecology

2.1 Introduction

2.2 Environment and globalization

2.3 The technology of geoinformation monitoring

2.4 Intelligent support technology in advanced ecology

2.5 Global model as the advanced ecology tool

2.6 Survivability principles

2.6.1 Preliminary comments

2.6.2 Basic definitions

2.6.3 Simple survivability model

2.6.4 Determining stable strategies

Chapter 3. Global Ecodynamics

3.1 Introduction

3.2 Present global ecodynamics

3.2.1. Resources and ecodynamics

3.2.2 Energy and greenhouse effect

3.2.3 Numerical modeling results

3.2.4 Preliminary conclusions

3.3 Trends in civilization development

3.4 Contemporary global ecodynamics

3.5 Media of the biosphere

3.6 Natural disasters as subject of advanced ecology

3.6.1 Introduction

3.6.2 Anthropogenic factors in advanced ecology

3.6.3 Modeling of demographic processes

3.6.4 Matrix model of the population size dynamics

3.7 Anthropogenic processes as subject for study in advanced ecology

3.8 Megapolises

3.9 Technogenic sources of natural disasters

3.10 Balance between nature and human society

3.11 Strategic aspects of prevention of natural disasters

Chapter 4. Effects of Global Warming and Advanced Ecology

4.1 Introduction

4.2 Global warming: facts and illusions

4.3 Earth's heat balance and society problems

4.4 Global warming: reality, suggestions, and fictions

4.5 Biogeochemical cycles in advanced ecology

4.5.1 Greenhouse gases and climate

4.5.2 Aerosols and climate

4.5.3 Empirical diagnostics of the global climate

4.5.4 Air temperature diagnostics

4.5.5 Snow and ice cover

4.5.6 Sea surface level and the ocean upper layer heat content

4.5.7 Other climatic parameters

4.5.8 Greenhouse gases and anthropogenic aerosol in the atmosphere

4.5.9 Paleoclimatic information

4.5.10 The radiative forcing

4.5.11 Some aspects of the climatic data reliability

4.6 Climate change factors

4.6.1 Climate change, forests, and agriculture

4.6.2 Space-based global observations

4.6.3 Human induced factors of climate change

4.6.4 A role of modeling results in understanding of climate

Changes

4.7 Socio-economic and ecological aspects of global warming

4.8 Biospheric perspectives

4.9 Society and its ecological restrictions

4.10 Ecological crises and disasters

4.11 Numerical modeling of the nature-society system dynamics

Chapter 5. Decision Making in Advanced Ecology

5.1 Risk control and sustainable development

5.2 Indicators of the efficiency of risk control in cases of natural disasters

5.3 Social and human dimensions of risk

5.4 Estimation of risk in the monitoring regime

5.5 Predicted risks of global change

5.5.1 Biospheric evolution and natural disasters

5.5.2 Global warming and natural disasters

5.5.3 The monitoring and prediction of the natural disasters

5.5.4. Potential future natural disasters

5.5.5 Assessments of the accomplishment of some scenarios

5.5.6 Concluding remarks

References
