UniSim Design Simulator for Chemical Engineering: A Didactic Approach

Content

1. UniSim Design Simulator Basics
 - 1.1. Application startup
 - 1.2. Chemical components and thermodynamic model
 - 1.3. Peng-Robinson thermodynamic model
 - 1.4. Activation of the simulation environment
 - 1.5. Application
2. Steady-State Modeling of a Two-Phase Separator
 - 2.1. Formulation of the problem
 - 2.2. Definition of the list of components
 - 2.3. Feed flow simulation
 - 2.4. Biphasic separator modeling
3. Simulation of a Refrigeration Production System
 - 3.1. Application: Simulation of a cold production system
 - 3.2. Defining the list of components and choosing the thermodynamic model
 - 3.3. Create the simulation diagram
 - 3.4. Process simulation
4. Simulation of a Distillation Column
 - 4.1. Application: Simulation of a distillation column
 - 4.2. Definition of the list of chemical components
 - 4.3. Creating the simulation diagram and configuring the modules
 - 4.4. Study of variants for specifying the variables necessary for the simulation of the distillation column
5. Modeling and Simulation of the Extraction Process of Hexane
 - 5.1. The specifics of the thermodynamic model
 - 5.2. Modeling of the extraction process
 - 5.3. Simulation of the extraction process
- IV
6. Simulation of a Demethanation Column
 - 6.1. The specifications of modeling an absorption column
 - 6.2. Modeling and simulation of the demethanation column
 - 6.3. Process sensitivity analysis
7. Numerical Analysis of Liquid-Vapor Equilibrium for Petroleum Products
 - 7.1. Stages in defining the list of components for petroleum products
 - 7.2. Choosing the thermodynamic model
 - 7.3. Loading the TBP curve of the petroleum product
 - 7.4. Specification of the Density of the Petroleum Product
 - 7.5. Visualization of the results on the Characteristics of the Petroleum Product

- 7.6. Definition of pseudocomponents associated with the TBP curve
- 7.7. Defining the material flow that contains pseudocomponents assign to the TBP curve
- 8. Modeling and Simulation of a Distillation Column with Side Products and Non-Condensable Gases
 - 8.1. Formulating the modeling problem
 - 8.2. Stages of mathematical modeling of the crude distillation column
 - 8.3. Transformation of the crude into mixture of chemical pseudocomponents
 - 8.4. Configuration of the model of the crude distillation column
 - 8.5. Specification of auxiliary variables
 - 8.6. Distillation column simulation
- 9. Tubular Furnace Simulation
 - 9.1. The Presentation of the Unisim FPH Simulator
 - 9.2. Formulation of the Problem
 - 9.3. General Configuration of the FPH Simulator
 - 9.4. Configuration of Combustion
 - 9.5. Configuration of Process Flows
 - 9.6. The Report Generated by the FPH Simulator
 - 9.7. Tubular Furnace Simulation
- V
- 10. Modeling the Ethylbenzene Dehydrogenation Reactor for Styrene Production
 - 10.1. The implementation of chemical reactions
 - 10.2. Configuration of the reactor feed flow
 - 10.3. Conversion reactor implementation
- 11. Modeling and Simulation of the Quality Control System for Propylene–Propane Distillation Column
 - 11.1. Simulation of the fractionation column
 - 11.2. Presentation of the automatic system for control the quality of products of the propylene-propane distillation column
 - 11.3. Controller programming using Unisim Design resources
 - 11.4. Quality control system simulation
- Bibliography
